

# MINIMISE MEDIA, MAXIMISE YIELDS

Combines the benefits of DWC and constantly circulating nutrients.

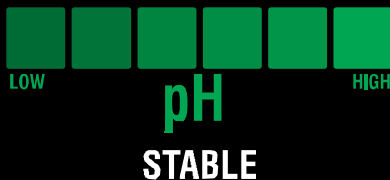

The solution is constantly circulated between the pots filling each pot to 4.5cm below the bottom of the pebbles.

There's no timing of feeds, the plants take-up whatever they need from the constantly available nutrient solution.

An air-pump provides air-flow to each pot and air stones in each pot constantly oxygenate the solution – making for an incredibly oxygen rich root-zone.

The constant circulation gives the plants another oxygen boost and keeps the pH and EC stable.

The 'remix' button on the RDWC control unit mixes with the nutrient solution, cooling it down before pumping it back to the pots. Whereas the RDWC with timer allows you to schedule mixes, pumping nutrients back to the water butt, keeping it cool and fresh.
